

Heat Pump Water Heater (Generation 4) Troubleshooting (Effective 1 Nov 2016)

No Power, Display, Fan or Compressor

Indications	Display
Nothing happens at all. No	There is not a display code for this problem.
compressor motor; no fan; no	Remember, the first thing we want to check is for the
display.	heater to be turned ON with the MODE selector.
Troubleshooting	Solution
1. See use and care manuals to turn	1. IF the touch screen display (TSD) is on, then
unit ON and set operating	enable heater by pressing the MODE button.
MODE.	2. Set mode to Energy Saver and thermostat to 120° F.
2. Check for the presence of power	3. Heater may be in 'pre-warm' mode*. Verify 240V
at the power connection plug.	power at the lower/upper heating element screw
3. If the display does not have any	terminals.
characters, then measure for	4. If there is power to the board and not TSD screen,
240V to the board between the	then replace the primary control board.
black and red wires.	5. If there is no power, check circuit breaker panel.

All current alarms and alarm history can be found by pressing "Service" then pressing "Alarms".

Setting MODE

Alarms

Control Power Plug Check

*When the control is powered up, or switched from "Water Heater OFF Mode" to an active mode or from the recovery of a tank thermistor failure and both the Lower Tank temperature is below 70°F and the upper Tank temperature is below 75°F, then the control enters a pre-warm mode before allowing a normal demand for heat. Pre-warm is not entered if tank temperature drops while running a normal heat demand.

Technical Competence, Product Confidence

Fan does not run:

- 1. Place unit in operating mode that uses the FAN. (Heat Pump Only, Energy Saver or High Demand)
- 2. From the control panel locate the test mode screen:
 - a. Press Service
 - b. Press Test Mode
 - c. Select EVAP FAN
 - d. Press Start Testing
- 3. IF the fan runs, then the control board and fan are probably working properly.
- 4. Turn off test mode.

		Water Heat	ler Test	Evap Fan	

- 5. IF the fan does not run, the remove the control cover.
- 6. Locate the FAN connection Molex and measure for 240 volts AC between the black and grey wires with the Molex in place.
 - a. If you have 240 volts AC, then set meter for AMP reading. (See your meter instructions on measuring AMPS!)
 - b. Once you set your meter for AMPS, the fan should be ON. Measure for AMPS (any reading is fine) between the black and grey wires with the Molex in place.
 - c. IF the fan does not RUN, then replace the fan assembly.
 - d. IF the fan does run, then replace the control board.

The control will energize electric heater elements if demand for heat exists and compressor is off because *Ambient temperature too high, Discharge Temperature Fault, Suction Temperature fault, Discharge - Suction Fault, Open High pressure switch*, or locked out due to too many faults (3 strike logic). The heater elements substitute for compressor until the fault clears and the anti-short cycle delay timer has expired.

Error A101 Suction Temperature Thermistor Failure

Indications	Display
Compressor Shutdown – Low Suction Thermistor	A101 Suction Temperature Thermistor Failure
Failure. This fault code indicates the thermistor is	
either in a 'short' or 'open' electrical status. The	Current Alarms
compressor remains locked out for the remainder of	A101 Suction Temperature Thermistor Failure
the heat demand.	
Troubleshooting	Solutions
1. Thermistor damaged.	1. Replace thermistor
2. Control board is damaged	2. Replace control board

All supplied thermistors are Therm-O-Disc 11JH, grade 1; 10,000 ohms @ 25C.

Heat Pump Water Heater (Generation 4) Troubleshooting (Effective 1 Nov 2016)

Error A102 Ambient Temperature Thermistor Failure

heating element operation at 145° F; and sh down the compressor at 160° F.

--	--

Error A103 Lower Heater Temp Thermistor Failure

Indications	Display
Lower Heater Temperature Thermistor Failure - This fault code indicates the thermistor is either in a 'short' or 'open' electrical status. The compressor remains locked out for the remainder of the heat demand. This thermistor is monitoring the lower tank temperature. <i>Only one heating element can be on at a time</i> .	A103 Lower Heater Temp Thermistor Failure Current Alarms A103 Lower Heater Temp Thermistor Failure
Troubleshooting	Solution
1. Thermistor damaged.	1. Replace thermistor
2. Control board is damaged	2. Replace control board

Any failure of the upper or lower tank thermistors is a condition upon which no heat can be delivered either via electric heater elements or the heat pump. Additionally, if any of the following thermistors fail, compressor operation is not allowed: suction, ambient, evaporator and discharge temperature.

Technical Competence, Product Confidence

Heat Pump Water Heater (Generation 4) Troubleshooting (Effective 1 Nov 2016)

Error A104 Upper Heater Temp Thermistor Failure

Indications	Display
Upper Heater Temperature Thermistor Failure - This	A104 Upper Heater Temp Thermistor
fault code indicates the thermistor is either in a 'short' or 'open' electrical status. The compressor remains	Failure
locked out for the remainder of the heat demand. This	Current Alarms
thermistor is monitoring the lower tank temperature.	A104 Upper Heater Temp Thermistor Failure
Only one heating element can be on at a time.	
Troubleshooting	Solutions
1. Thermistor damaged.	1. Replace thermistor
2. Control board is damaged	2. Replace control board

Any failure of the upper or lower tank thermistors is a condition upon which no heat can be delivered via either electric heating elements or the heat pump.

Error A105 Evaporator Temp Thermistor Failure

Indications	Display
Evaporator Temperature Thermistor Failure - This fault code indicates the thermistor is either in a 'short' or 'open' electrical status. The compressor remains locked out for the remainder of the heat demand. Electric heating elements complete the current water heating cycle.	A105 Evaporator Temp Thermistor Failu Current Alarms A105 Evaporator Temp Thermistor Failur
Troubleshooting	Solutions
 Thermistor damaged. Control board is damaged 	 Replace thermistor Replace control board

configuration. The control knows what it needs to do.	
Cycle heater at the circuit breaker. Check for proper operation.	

Heat Pump Water Heater (Generation 4) Troubleshooting (Effective 1 Nov 2016)

Error A125/126 Lower/Upper Element Error or Relay Stuck Closed

Indications	Display
The control board logic can detect 4 heating element errors: lower element not connected or open upper element not connected or open lower element relay stuck on upper element relay stuck on	Current Alarms A126 Upper Element Error or Relay Stuck Closed
Troubleshooting	Solutions
1. Check resistance of the heating element	1. Replace element
	2. Replace control board

Note: The current Gen4 design utilizes larger (5000W) heating elements, and the unit and algorithm provide the capability of bringing only one element ''ON'' at a time. With this in mind, although we may start with the upper element, there is safety logic, which manages the elements in deference to the algorithm to protect the water supply and to enhance the heating of the entire tank of water.

Error A128/129 Lower/Upper Element Relay Failure to Close Error

Indications	Display
The A2D (analog to digital) converters for the hybrid	
are integrated into the controller. In order to qualify the	
operation of the converters it is reasonable to assume	
that the A2D counts for either the upper or lower tank	
temperatures must change periodically. If not, they can	
be assumed to be "stuck" whereby the unit will disable	
heating and call out one of these alarms.	
If the control board detects that its internal A2D	
converters are not functioning for 4 minutes	
continuously, an alarm will be generated.	
Troubleshooting	Solutions
1. Cycle heater at the circuit breaker and return	1. Replace control board
to normal operations. If the fault code returns,	
replace the control board.	

Heat Pump Water Heater (Generation 4) Troubleshooting (Effective 1 Nov 2016)

Error A107 Water Leak Detected

Indications	Display
This alarm indicates the control board senses water in the drain pan (potential water heater leaking). The leak detector rope is placed in the drain pan and will tell the control board if it comes in contact with water.	Current Alarms A107 Water Leak Detected
Troubleshooting	Solutions
1. Inspect the area of the leak detector rope for water	1. Remove leak detector rope and let it dry out (false alarm)
Check that the T&P valve is not operating due to thermal expansion	2. Replace tank due to internal tank leak

Error A110 Lower Temperature Conversion Stuck Error A111 Upper Temperature Conversion Stuck Error A112 Upper/Lower Temperature Conversion Stuck Error A113 A2D Reference Conversion Drift Error

Indications	Display
The A2D (analog to digital) converters for the hybrid are integrated into the controller. In order to qualify the operation of the converters it is reasonable to assume that the A2D counts for either the upper or lower tank temperatures must change periodically. If not, they can be assumed to be "stuck" whereby the unit will disable heating and call out one of these alarms	A110 Lower Temperature Conversion Stuck Error A111 Upper Temperature Conversion Stuck Error A112 Upper/Lower Temperature Conversion Stuck Error A113 A2D Reference Conversion Drift Error
If the control board detects that its internal A2D converters are not functioning for 4 minutes continuously, an alarm will be generated.	
Troubleshooting	Solutions
1. Cycle heater at the circuit breaker and return to normal operations. If the fault code returns, replace the control board.	1. Replace controller

These faults mostly have to do with the controls boards reading (digital) of the resistance readings of the various thermistors (analog).
