

Ultra Low NOx PowerVent with Honeywell Electronic Control
California Only

Error Code Flash Display

Gas Valve "Status" Flash Code	Control Status
Short flash once every four seconds	IDLE (no call for heat, no fault conditions)
"Heartbeat", alternates bright/dim	Call For Heat (no fault conditions)
One Flash, three second pause	Low flame signal (control continues to operate)
Two Flash, three second pause	Pressure switch failed closed
Three Flash, three second pause	Pressure switch failed open
Four Flash, three second pause	Thermal Cut Off limit lockout
Five Flash, three second pause	Flame out of sequence
Six-One Flash, three second pause	Failed trial for ignition
Six-Two Flash, three second pause	Recycle limit - PS/limit opened
Six-Three Flash, three second pause	Recycle limit - flame lost
Six-Five Flash, three second pause	Hard Lockout; manual reset required
Seven Flash, three second pause	Flammable vapor sensor lockout
Eight-One Flash, three second pause	FVS fault detected
Eight-Two Flash, three second pause	Temperature sensor fault detected
Eight-Three Flash, three second pause	Electronics fault detected
Eight-Four Flash, three second pause	Valve fault detected

No Power or No Blower Motor

Indications	Display
Nothing happens at all. No blower motor; no sounds.	There is not a display code for this problem.
Troubleshooting	
<ol style="list-style-type: none"> 1. Check wall plug power with a table lamp. 2. Check that the unit is plugged in. 3. Verify gas control switch is ON. 4. Verify power to the gas control thru the black wire (pin #1) on the gas valve Molex. Turn up thermostat on gas valve; observe blinking blue light; otherwise replace control. 5. Turn thermostat all the way up. Verify power to the blower at the yellow wire (pin #3) on the gas valve Molex. Replace blower if there is power on the yellow wire, but no blower motor. Replace control if you have power on the black wire and not on the yellow wire. 	

Error 1 flash

Indications	Display
Low flame signal (control continues to operate)	One Flash, three second pause
Troubleshooting	
<ol style="list-style-type: none"> 1. Low gas supply pressure 2. Carbon buildup on electrode 3. Pilot tube restriction 	<ol style="list-style-type: none"> 1. Verify gas pressure with rating plate on water heater. 2. Clean spark electrode and pilot hood with steel wool. 3. Inspect pilot tube for obstructions

**Ultra Low NOx PowerVent with Honeywell Electronic Control
 California Only**

Error 2 flash

Indications	Display
<p>PS Failed Closed at start of Call for Heat – The control checks for an OPEN pressure switch at the start of a call for heat. If not found, the control waits four seconds then begins to flash error code. The control waits 2 minutes, and then turns on the inducer for 30 seconds. The inducer shuts off after 30 seconds and the control returns to waiting for the pressure switch to open. The control will attempt this sequence 5 times before entering into a hard lockout.</p>	<p>Two Flash, three second pause</p> 
Troubleshooting	Solution
<ol style="list-style-type: none"> 1. Faulty pressure switch 2. Pressure switch is jumped 3. Inspect tubing for blockage 	<ol style="list-style-type: none"> 1. Do continuity test on pressure switch. If there is continuity, replace pressure switch. 2. The hard lockout will require a manual power cycle of the control to clear the hard lockout.

Error 3 flash

Indications	Display
<p>Pressure switch failed open (failed to close) – at the beginning of the heat cycle the control runs the inducer for 30 seconds waiting for the Pressure Switch to close. If the PS does not close in 30 seconds, the inducer turns off and the control flashes PS Failed Open error code. The control waits in this PS Failed Open mode for 2 minutes before turning on the inducer and trying for another 30 seconds to see the PS close. This cycle repeats for a maximum of five times before entering a hard lockout.</p>	<p>Three Flash, three second pause</p>
Troubleshooting	Solution
<ol style="list-style-type: none"> 1. Vent blockage or improper installation 2. Switch tube blockage 3. Faulty pressure switch 4. Blower improper operation 5. Over temperature switch open <p>TIP: Rule out the water heater with the following process. Remove all PVC venting from the blower assy. Recycle water heater for main burner.</p> <ul style="list-style-type: none"> ✓ IF the water heater goes to main burner, then the water heater is not at fault. Check venting. ✓ IF the water heater does NOT go to main burner, then we have a part problem with the water heater. 	<ol style="list-style-type: none"> 1. Inspect venting run for blockage 2. Verify over temp switch is cool to the touch 3. Inspect pressure switch tube for blockage 4. Check blower for proper operation 5. Replace pressure switch 6. The hard lockout will require a manual power cycle of the control to clear the hard lockout.

Ultra Low NOx PowerVent with Honeywell Electronic Control
California Only

Error 4 flash

Indications	Display
ECO limit lockout - Water temperature sensed in excess of ECO limit (199°) - the control immediately turns off pilot and main valves and enters ECO Limit Lockout. During ECO Limit Lockout, the inducer motor runs continuously.	Four Flash, three second pause
Troubleshooting	Solution
<ol style="list-style-type: none"> 1. Thermal well fault 2. Gas control fault <p>TIP: See Error 8-2 on how to measure water temp and verify thermistors.</p> 	<ol style="list-style-type: none"> 1. The sensed water temperature must be below 120F°. Flush tank with cold water. 2. Power must be cycled to remove the control from ECO limit hard lockout.

Error 5 flash

Indications	Display
Flame Sensed Out Of Sequence - the control only looks for pilot flame when the inducer is running. If flame is present when the pilot valve is not open, the control proceeds to Wait Flame Lost and flashes the Flame out Of Sequence error code. Blower remains on.	Five Flash, three second pause
Troubleshooting	Solution
<ol style="list-style-type: none"> 1. Pilot or main burner valve has failed open 	<ol style="list-style-type: none"> 1. Recycle heater to verify error code 2. Replace gas control valve

Error 6-1 flash

Indications	Display
Failed trial for ignition; Maximum ignition attempts. If flame is not sensed during the Trial period, the igniter turns off, the pilot valve closes, the control runs Post-purge then turns of the inducer. The control remains in Soft Lockout for 5 minutes before responding to the demand for heat. If the control has entered Soft Lockout three times, the control will enter hard lockout.	Six-One Flash, three second pause
Troubleshooting	Solution
<ol style="list-style-type: none"> 1. Low gas supply pressure 2. Carbon buildup on electrode 3. Igniter Wire damage 4. Combustion air blockage 5. Pilot tube restriction 	<ol style="list-style-type: none"> 1. Verify gas pressure with rating plate on water heater. 2. Clean spark electrode and pilot hood with steel wool. 3. Verify igniter spark at electrode. If the igniter sparks, then the problem should be fuel or air related. 4. Verify air inlet holes on side of water heater are clean and clear 5. Inspect pilot tube for obstructions 6. This lockout can only be cleared by manually cycling the control power.

Ultra Low NOx PowerVent with Honeywell Electronic Control
California Only

<p>1. Confirm to see if the pilot bracket is firmly attached to the burner body</p>	
<p>2. Ensure that the gap between pilot hood and burner screen surface is 0.329" (5/16" drill bit).</p> <p>Gap is measured from the perforated burner wall to the inside edge of the pilot hood.</p> <p>The top of the pilot supply burner hood should be on a level plane with the third solid band from the bottom of the burner pan.</p>	

Error 6-2 flash

<p>Indications</p> <p>Recycle limit - PS/limit opened – Maximum number of retries has occurred. Unit will try for main burner three times. Then the unit is in hard lock-out and must be manually reset.</p>	<p>Display</p> <p>Six-Two Flash, three second pause</p>
<p>Troubleshooting</p> <ol style="list-style-type: none"> 1. Check venting to insure pressure switch is not momentarily opening as the appliance warms. 2. Check vent outlet for wind-gust problems. <ol style="list-style-type: none"> 1. Check PS wiring. 2. Check PS rubber tube for blockage. 3. Check over temp switch. 4. Faulty pressure switch. 	<p>Solution</p> <ol style="list-style-type: none"> 1. Correct any PVC vent issues. 2. Repair wiring or clear tube blockage. 3. Replace pressure switch. 3. The hard lockout will require a manual power cycle of the control to clear the hard lockout.

Ultra Low NOx PowerVent with Honeywell Electronic Control
California Only

Error 6-3 Flash

Indications	Display
<p>Flame lost during RUN: During the heating cycle, the <i>pilot flame</i> is lost. The control turns off the pilot and main valves, runs Inter-purge, increments the Recycle Count and, if the Recycle count limit has not been reached, begins another Trial for Ignition. If the Recycle Count Limit has been reached, the control enters soft lockout. The control remains in soft lockout for 15 minutes before responding to the Demand for Heat. This clears the Recycle Count to allow for another set of "Recycle Count Limit" recycles. A total of three such sets of ignition trials including the first ignition trial set to be attempted. If the control has entered soft lockout for the total number of ignition trials as specified above the control will enter hard lockout. This lockout can be cleared by manually cycling the control power.</p>	<p>Six-Three Flash, three second pause</p>
Troubleshooting	Solution
<ol style="list-style-type: none"> 1. Check pilot flame to insure flame is not lifting away from flame sense hood – when main burner ignites. 2. Check static and dynamic gas supply to insure pressure is maintained when main burner lights. 3. Check for leaking pilot supply tube. 4. Check for carbon/soot buildup on pilot grounding strap. 5. Baffle or Baffle collar is not in correct position. Baffle or Baffle collar is not in correct position. 	<ol style="list-style-type: none"> 1. Verify gas pressure with rating plate. 2. Clean pilot supply hood to enhance flame rectification readings. 3. Reposition pilot igniter into proper position. 4. Replace pilot igniter. 5. If blower motor is hot to the touch, the inspect baffling and baffle collar. 6. Inspect baffle and baffle collar for proper positioning.

Error 7 flash

Indications	Display
<p>Flammable vapor sensor lockout – FVS resistance is > 100 KΩ and < 300KΩ - the control immediately turns off all outputs (valves closed, inducer off, ignition off). Control enters hard lockout and registers Flammable Vapor Present error code.</p>	<p>Seven Flash, three second pause</p>
Troubleshooting	Solution
<ol style="list-style-type: none"> 1. Gasoline or other flammable gas (hydrocarbons) was detected by the flammable vapor sensor. 	<ol style="list-style-type: none"> 1. Check for flammable vapors around water heater 2. Verify FVS sensor resistance ~ 9KΩ -45 KΩ 3. Replace FVS sensor if >45 KΩ 4. Reset gas control valve. Hard lockout to be cleared when the power is manually cycled, the control dial is rotated through the HOT setting 7 times within 30 seconds and the resistance of the sensor is within the normal operation range.

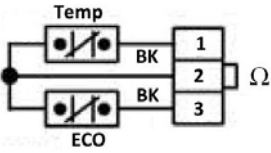

**Ultra Low NOx PowerVent with Honeywell Electronic Control
 California Only**

Error 8-1 flash

Indications	Display
FVS fault detected - FVS < 7 KΩ or > 300 KΩ - the control immediately turns off all outputs (valves closed, inducer off, ignition off) and enters Hardware Error Lockout and registers Flammable Vapor Device Interface/Miswiring error code.	Eight-One Flash, three second pause
Troubleshooting	Solution
<ol style="list-style-type: none"> 1. Flammable vapor sensor resistance is out of range (well below or well above parameters) 2. Wiring to FV sensor is faulty (open) 3. Gas control is faulty 	<ol style="list-style-type: none"> 1. Verify FVS sensor resistance ~ 9KΩ -45 KΩ 2. Replace sensor and wiring harness. 3. Replace control if new sensor does not work. 4. Hard lockout will be cleared when the power is manually cycled, the control dial is rotated through the HOT setting 7 times within 30 seconds and the resistance of the sensor is within the normal operation range.

Error 8-2 flash

Indications	Display
Thermal well fault - Temperature Sensors not reading the same temperature within ± 5.5 °F (measure when water temperature is changing less than 1 °F/minute). There are two thermistors on the temperature sensor housing. The control looks at both sensors to determine water temperature. Hardware Fault Lockout self clears if the fault clears for at least 15 seconds.	Eight-Two Flash, three second pause 
Troubleshooting	Solution
<ol style="list-style-type: none"> 1. Water temperature sensor fault. Measure the OHMS resistance between pins 1 and 2; then measure the resistance between pins 3 and 2. The two number should be the same. <p>See chart on last page to convert OHMS to temperature.</p>	<ol style="list-style-type: none"> 1. Recycle power to verify error 2. Replace thermal well <div style="display: flex; justify-content: space-around; align-items: center;">   </div>

Ultra Low NOx PowerVent with Honeywell Electronic Control
California Only

Error 8-3 flash

Indications	Display
Electronics fault detected -	Eight-Three Flash, three second pause
Troubleshooting	Solution
1. Gas control fault	1. Recycle heater to verify error code 2. Replace gas control valve

Error 8-4 flash

Indications	Display
Valve fault detected	Eight-Four Flash, three second pause
Troubleshooting	Solution
1. Gas control valve needs to be reset or has been damaged.	1. Recycle power to verify error 2. Replace gas control

Reset Gas Control

This will clear the current fault and force the unit to recycle for ignition.

1. Turn temperature control knob all the way clockwise
2. Recycle power to the heater (both blower and gas valve)
3. Rotate the temp knob all the way to the left, then back to the right. You must cross the midline seven (7) times within 30 seconds to reset the gas valve.
4. Unit should return to normal operations if all faults have been cleared and repaired. You will hear the blower motor come on.
5. Set water temperature to a safe setting of 120° or less.

Replacing the Gas Control.

The electronic component for the gas valve is replaceable without draining the water from the tank. To replace just the electronic control portion:

1. Turn off the gas valve. Unplug the water heater.
2. Remove wiring harnesses from the gas valve.
3. Remove main burner supply tube and pilot supply tube.
4. Remove / disconnect gas supply line.
5. Grab the bottom of the gas valve (at the main burner supply tube area) and lift up and out at the same time. There are two small plastic locking tabs that will release.
6. The electronic component will slide up and off the thermal well still installed in the tank.
7. Replace the control in reverse order.
8. Reconnect fuel supply lines and tubes.
9. Reconnect wiring harnesses.
10. Recycle power to the water heater.
11. Set the water temperature not to exceed 120° F.
12. Check for safe water heater operations.
